Phase Residuals

- Generally try to reduce phase residuals as much as possible.
- Are we making any assumptions in the processing?

Phase Residuals

- Generally try to reduce phase residuals as much as possible.
- Are we making any assumptions in the processing?
- YES! Remember all the troposphere, ocean load and other models?
- Worthwhile to investigate phase residuals for systematic 'signals'!
- Might find new application for GPS!

Plumes: What's with Remote Sensing?

Satellite Repeat Times:

Sensor	Temporal Resolution	Spatial Resolution
AVHRR	1-6 h	1×1 km
MODIS	2×daily	1×1 km
GOES	25 min	TIR: 4-8 km
OMI	2×daily	13×24 km
ASTER	16 days	TIR: 90 m

Webley et al., JVGR (2013)

Reflectometry with Multipath

- direct (A_d) and reflected (A_m) signals interfere – multi-path
- interference effect provides:
 - how wet reflecting surface is
 - distance between reflecting surface and antenna
- High-precision GNSS antennas are designed to suppress multipath
- don't entirely remove it, but $A_m \ll A_d$ (A is SNR Amplitude, see below)

Fig. 2 Geometry of a single ground-bounce multipath signal and effects on signal power, for antenna height h and satellite elevation angle θ . Concentric dashed circles indicate power levels of receiving antenna gain pattern G (solid line), while arrows indicate GPS signal paths. For an incoming GPS signal of power P , the direct signal will pierce the gain pattern at an angle equivalent to the satellite elevation angle, so that $A_d = PG(+\theta)$. A parallel incoming signal will be reflected from the ground and attenuated by a reflectivity factor R_s . Assuming perfect specular reflection, the attenuated, multipath signal will enter the gain pattern at the negative (below-horizon) satellite elevation angle, so that $A_m = (PR_s) G(-\theta)$. In general, $G(+\theta) >> G(-\theta)$. Gain pattern pierce points are indicated by large filled circles, with elevation angles marked on the outside ring

Reflectometry with Multipath

- new L2 C/A (L2C) (Block IIR-M satellites and above) 20 db-Hz improvement in recorded SNR over old L2 signals
- direct component of SNR must be removed
- MP contribution to SNR is small, but oscillatory
- direct contribution to SNR large in magnitude, but only 1 complete cycle per satellite pass
- depending on application discard data above/below certain elevation angles

Fig. 3 a L2 SNR data for satellite (PRN) 9 at TASH on 2005 March 26; b SNR data for setting satellite with direct signal contribution removed with a low-order polynomial

Larson et al., 2008, GPS Solutions

Reflectometry with Multipath

- multipath from horizontal, planar reflectors (ground) simple to model
- multipath affects all observations (pseudorange, carrier phase, SNR), focus on SNR!
- SNR independent of orbits, atmospheric delays, clocks!
- MP contribution to GPS SNR (signal to noise ratio):

Reflectometry with Multipath

- multipath from horizontal, planar reflectors (ground) simple to model
- multipath affects all observations (pseudorange, carrier phase, SNR), focus on SNR!
- SNR independent of orbits, atmospheric delays, clocks!
- MP contribution to GPS SNR (signal to noise ratio):

$$SNR = A \cos \left(\frac{4\pi h}{\lambda} \sin(E) + \phi \right)$$

$$f = \frac{4\pi h}{\lambda}$$

- SNR : signal to noise ratio
- f : multipath frequency
- h : antenna height
- λ : GPS signal wavelength
- E : satellite elevation angle
- A : SNR amplitude
- ϕ : SNR phase offset

Reflectometry with Multipath

- SNR interference pattern related to:
 - snow depth: linearly related to SNR frequency
 - soil moisture: near surface changes produce small changes in SNR phase offset
 - vegetation water content: decreases in SNR amplitudes
- Daily products at <http://xenon.colorado.edu/portal>.

Figure 7. Snow depth measured at GPS site near Galena, Idaho for three water years. For clarity, error bars are not shown, but on average are 4 cm.

Figure 5. GPS vegetation index (left axis and blue circles) compared with NDVI (right axis and green circles). Cumulative precipitation derived from NLDAS is shown in black.

Figure 8. Volumetric soil moisture estimated at a PBO site in Northern California. Daily precipitation data come from NLDAS.

Larson and Small, 2014, Proc. IGARSS

Getting Data. From where?

1) Your own campaigns: periodically go out and occupy benchmarks

Getting Data. From where?

2) build continuous sites (\$10+ k)

3) data archives

- **UNAVCO DAI** <http://www.unavco.org/data/gps-gnss/data-access-methods/dai2/app/dai2.html>
- **UNAVCO FTP** <ftp://data-out.unavco.org/pub/>
- **SOPAC** <ftp://garner.ucsd.edu/pub/>,
<http://sopac.ucsd.edu/dataBrowser.shtml>
- **UNR (products)** <http://geodesy.unr.edu/billhammond/gpsnetmap/GPSNetMap.html> (**have ftp, too**)
- **regional networks, e.g. BARD:**
<http://seismo.berkeley.edu/bard/>

Getting Data. From where?

3) data archives (continued)

- **Japan GEONET:** open, but need to register `http://datahouse1.gsi.go.jp/terras/terras_english.html`
- **New Zealand GEONET:** `ftp://ftp.geonet.org.nz/gps/`,
1Hz: `ftp://ftp.geonet.org.nz/rtgps/rinex1Hz/PositionZ/`
- NSF funded research required to make data available publicly, not all research in US NSF funded, though
- Other countries may not have open data sharing policy - contact potential collaborators!
